

How to Install **Lightroom Profiles**

Lightroom

versions 1.3 + **(not Lightroom Classic)**

A Note for Lightroom Mobile Users

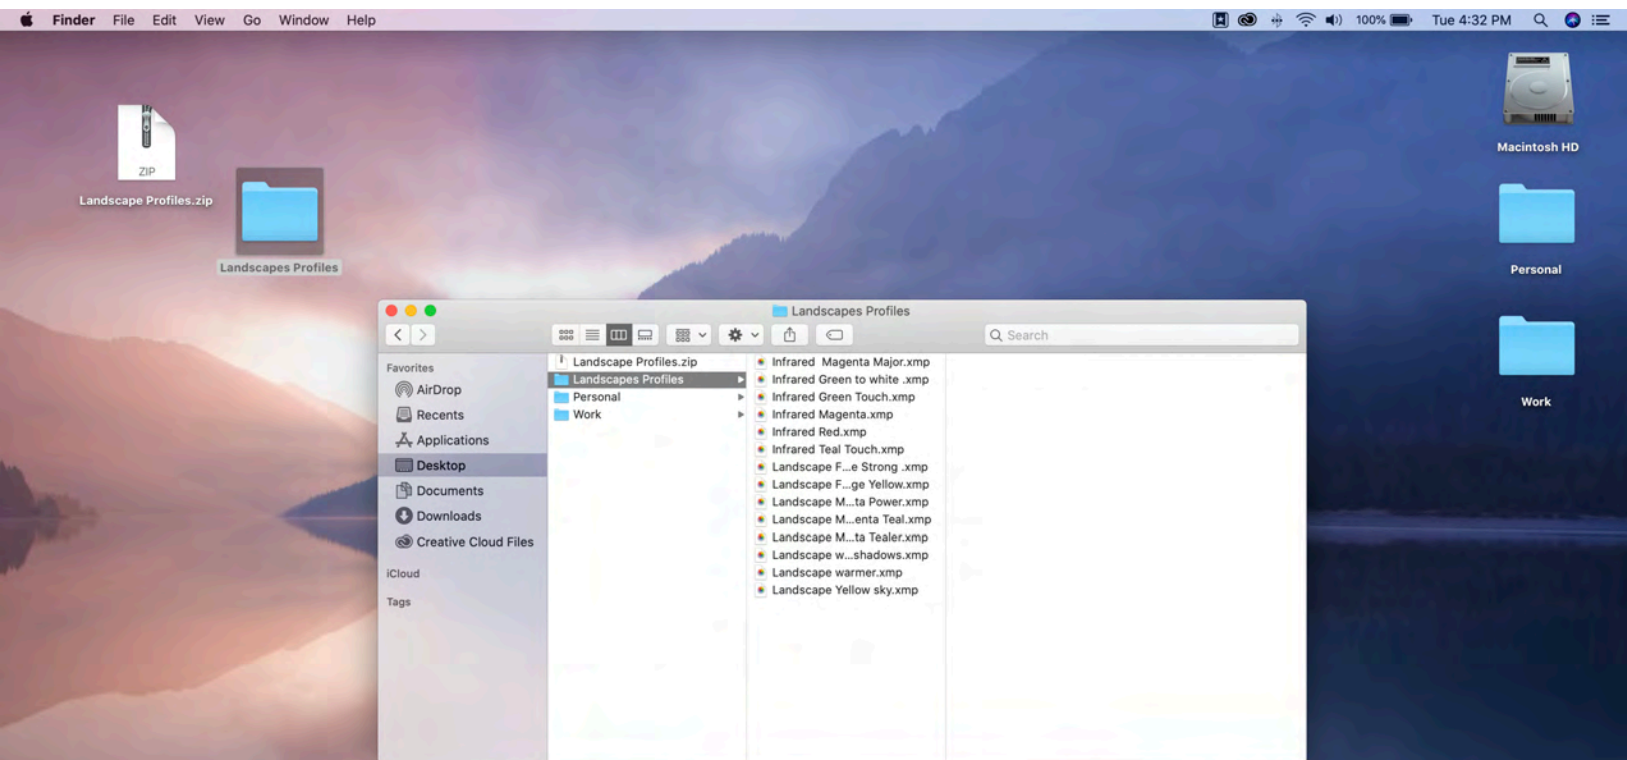

Mobile

This tutorial will guide you through the desktop installation *then* the mobile sync.

1. Prepare your profiles folder

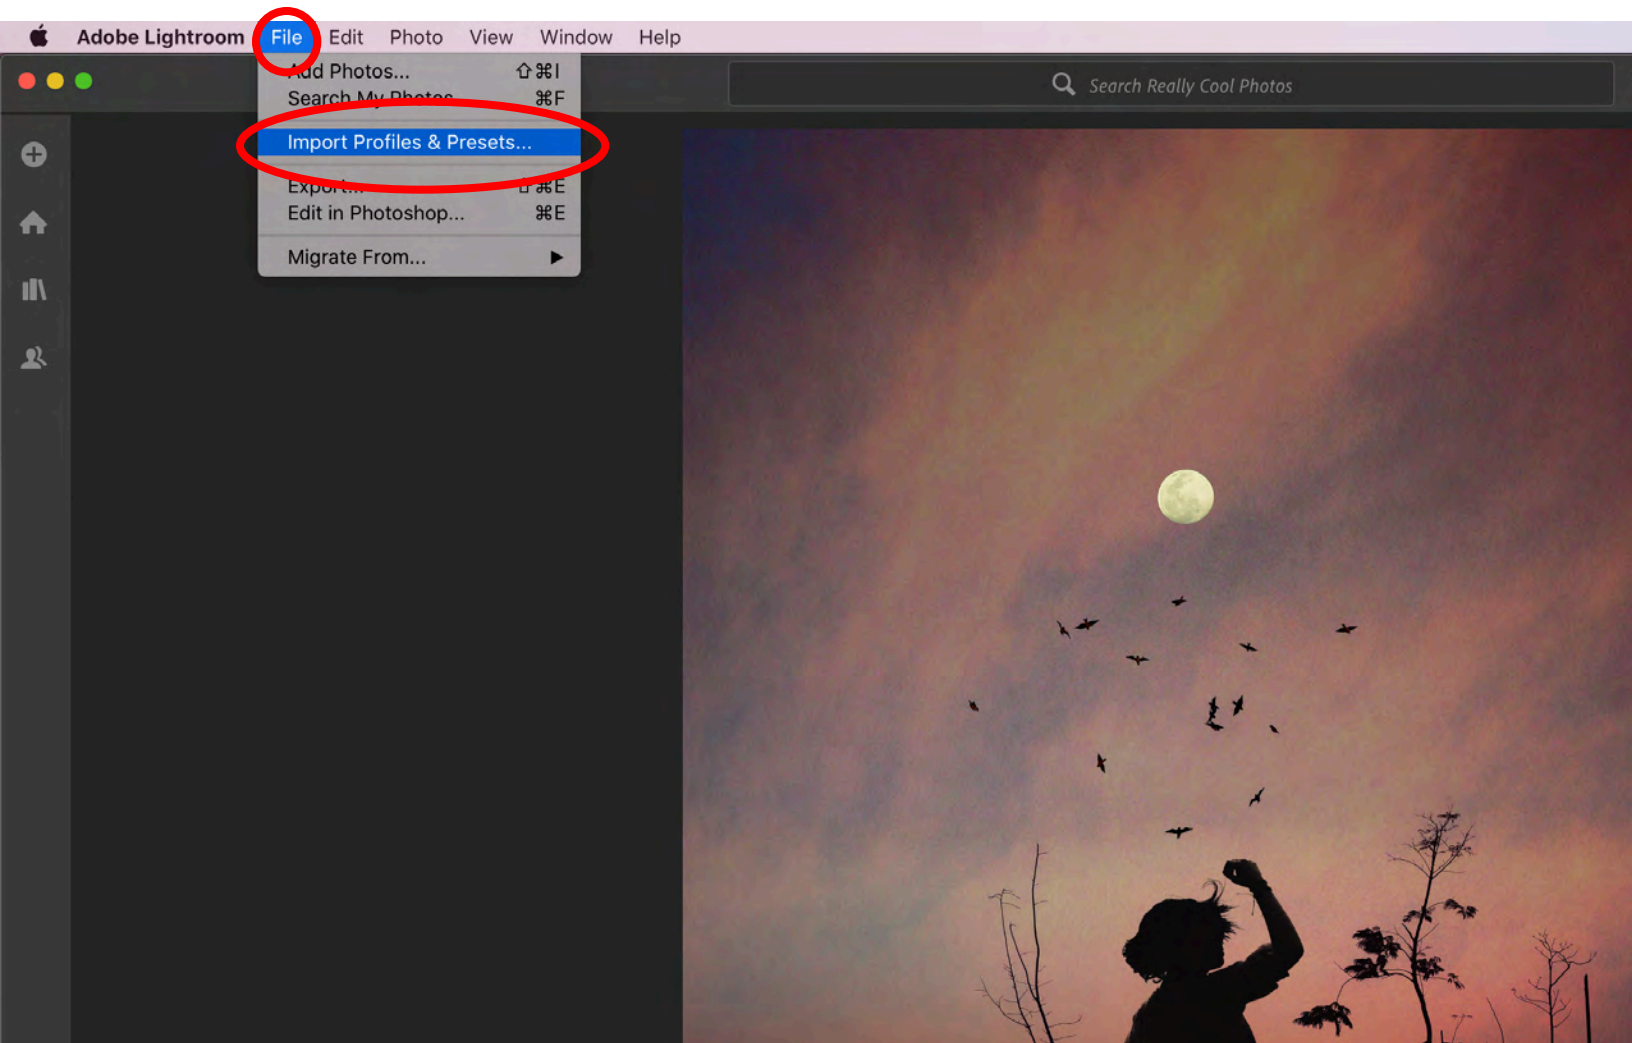

Download and unzip your profiles folder.

2. Prepare Lightroom for import

Launch Lightroom as your normally would and open an existing image.

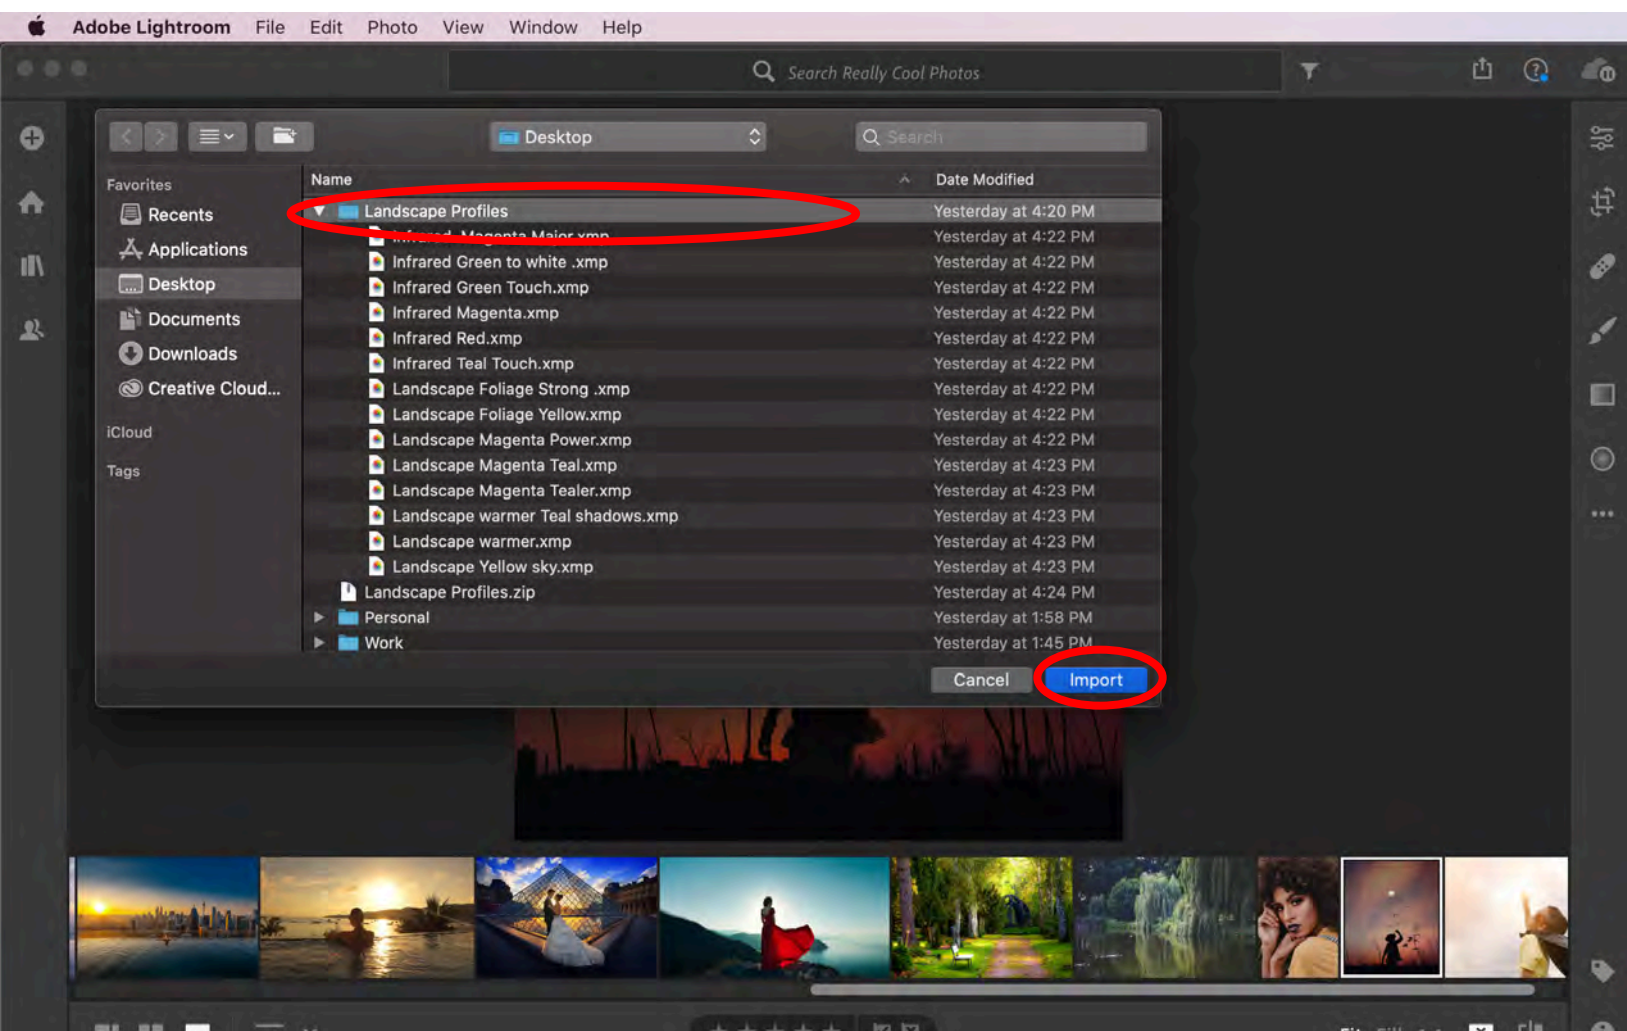

From the top menu bar, click File and select **Import Profiles & Presets.**

3. Import your new profiles

Select the unzipped folder containing your presets and click **Import**.

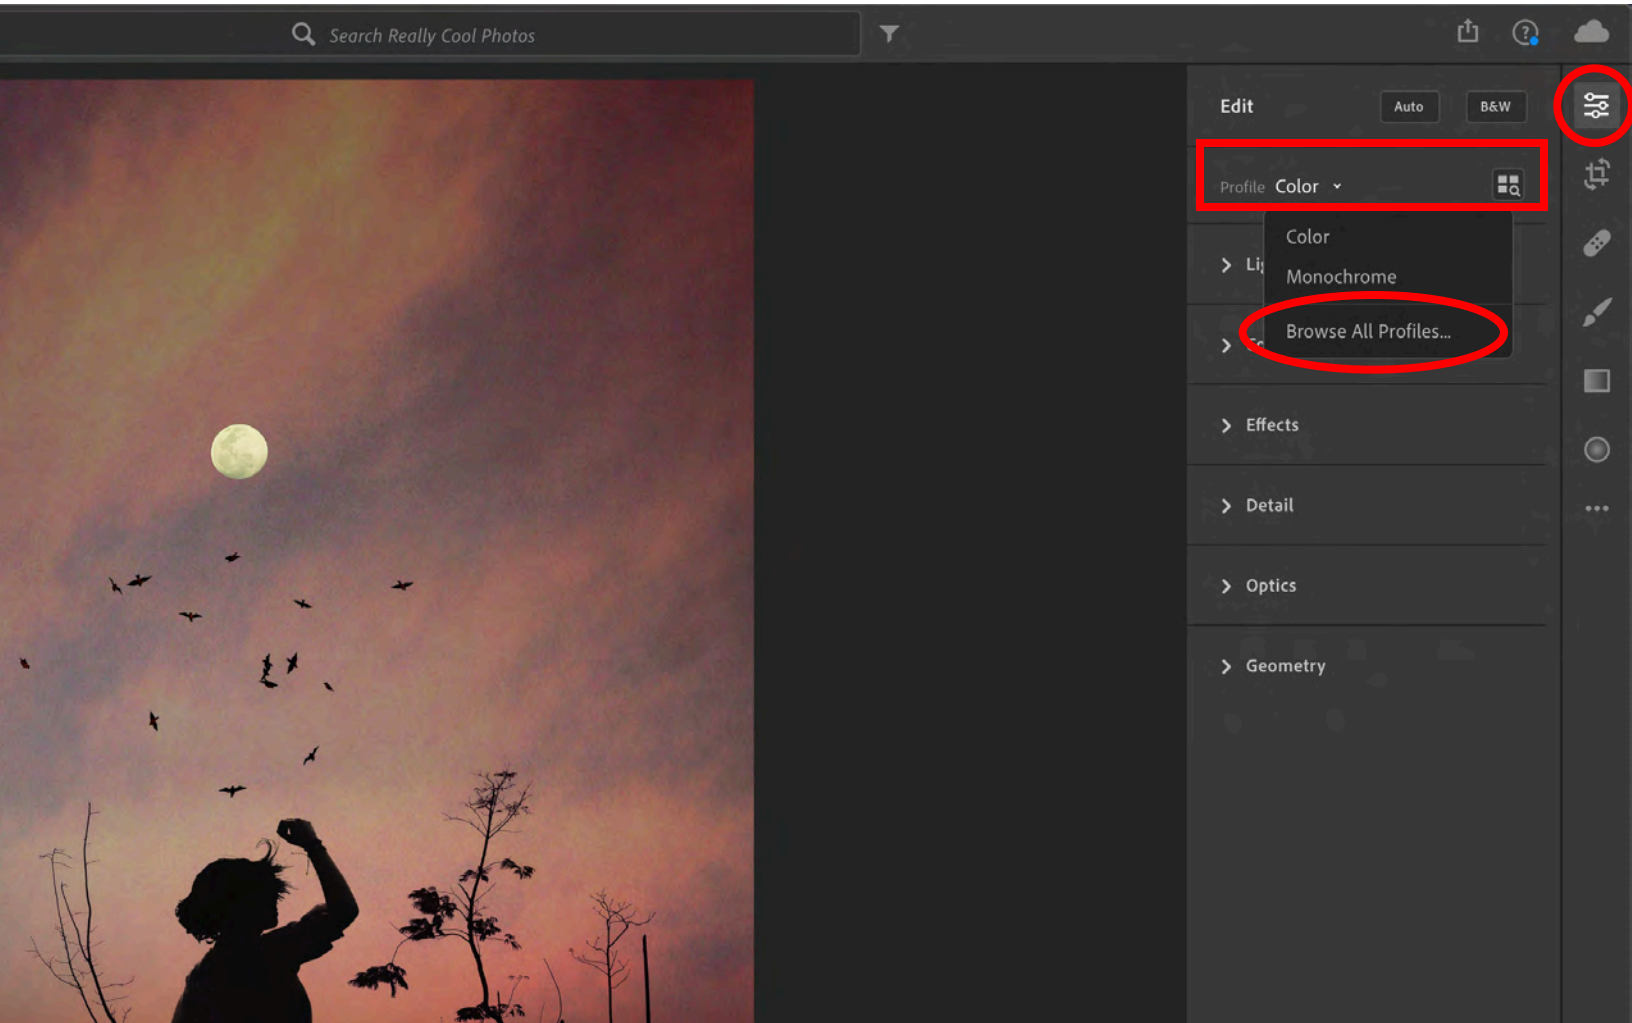

Note: You can instead select the zip file itself OR the folder you want to install, all methods will work.

4. Navigate to profiles in Lightroom

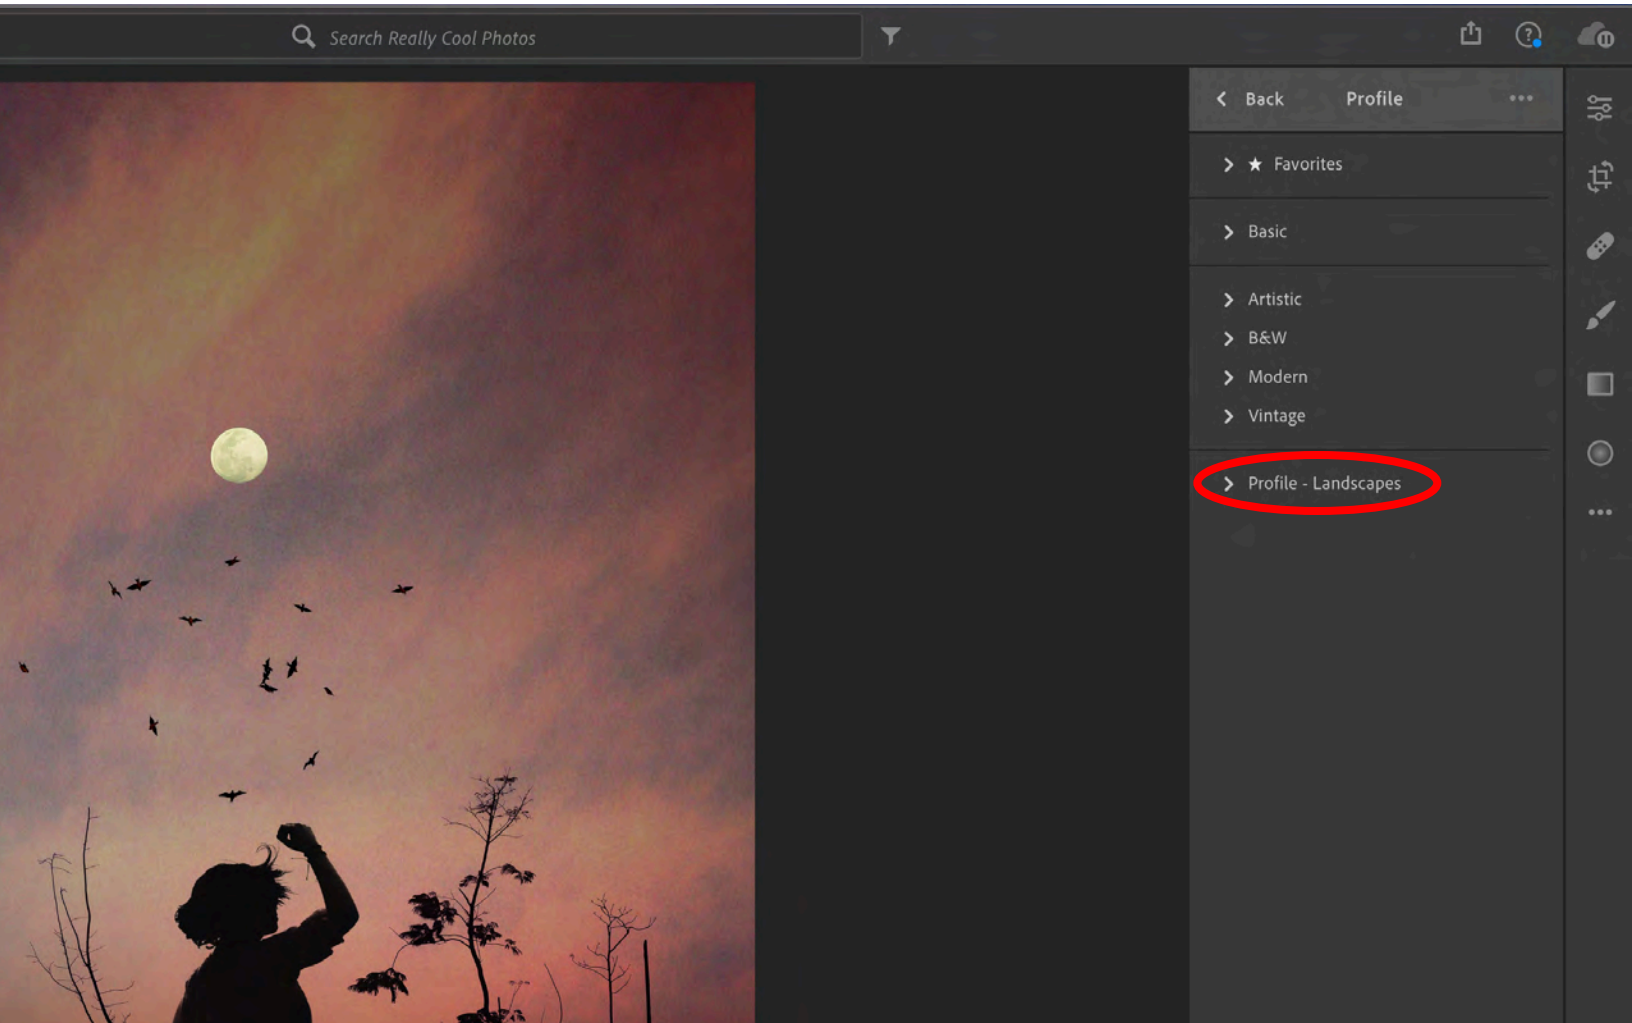

From the right toolbar, click the **Edit icon**.

Click the Profile dropdown menu and click **Browse All Profiles...**

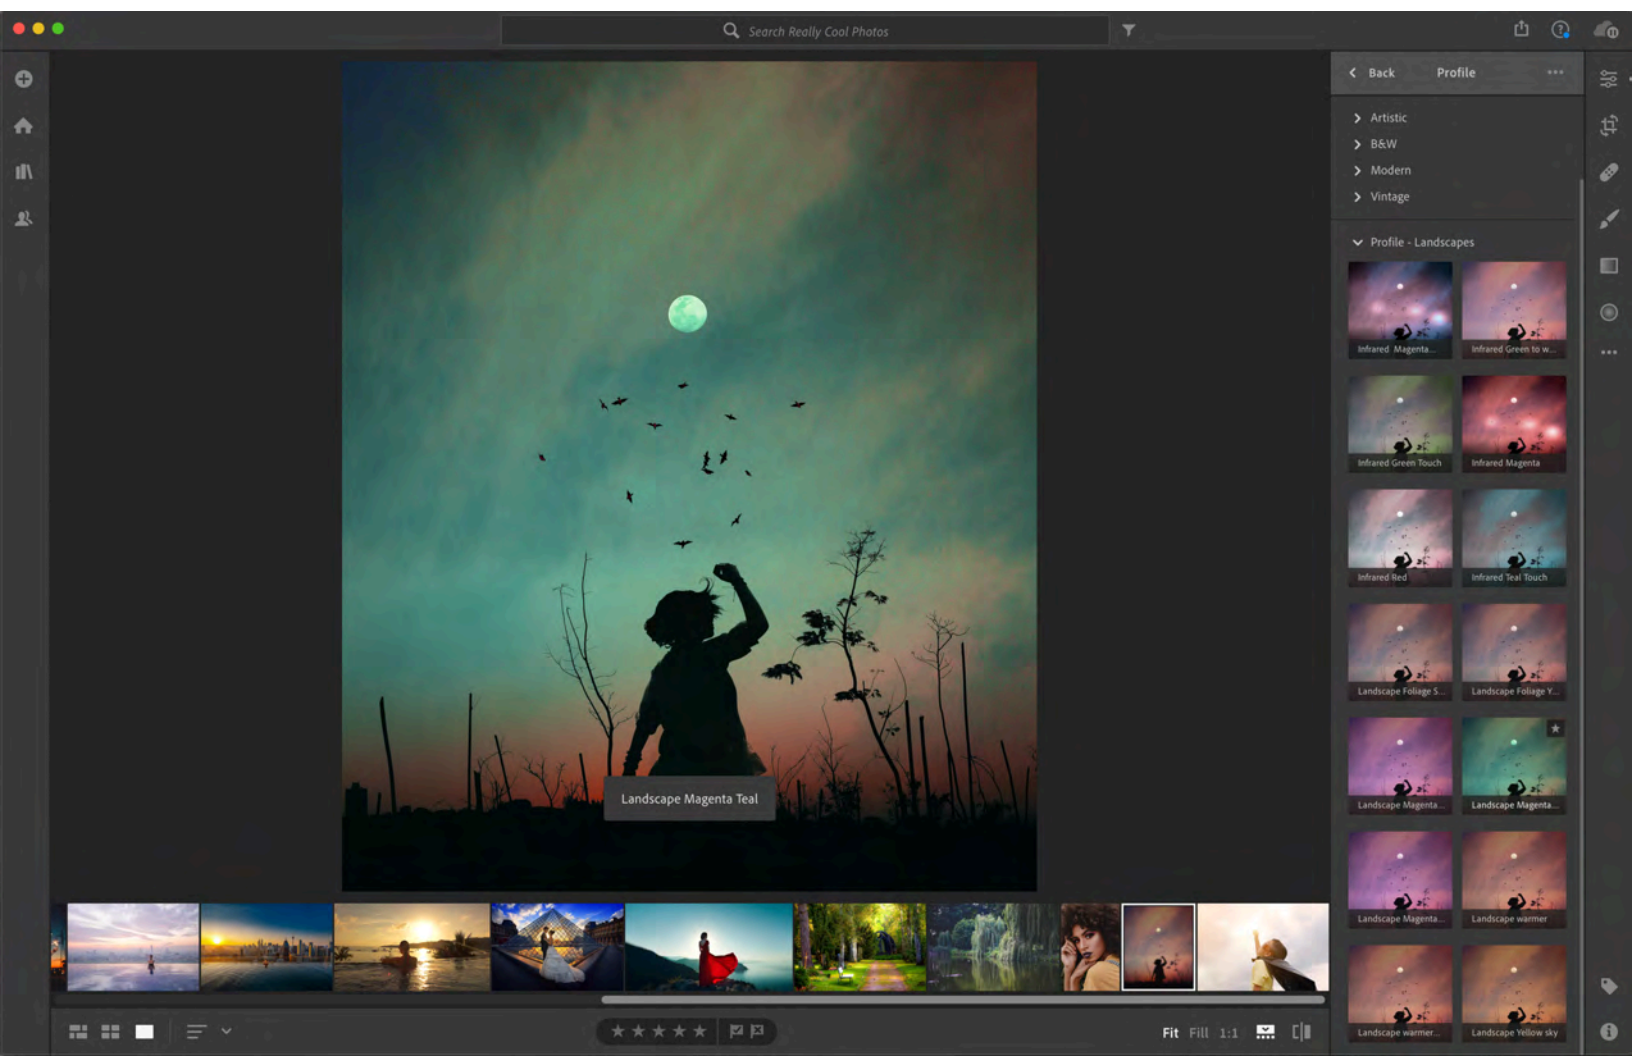

5. Locate your new profiles

Find and expand the profiles you just imported.

6. Hover & Select

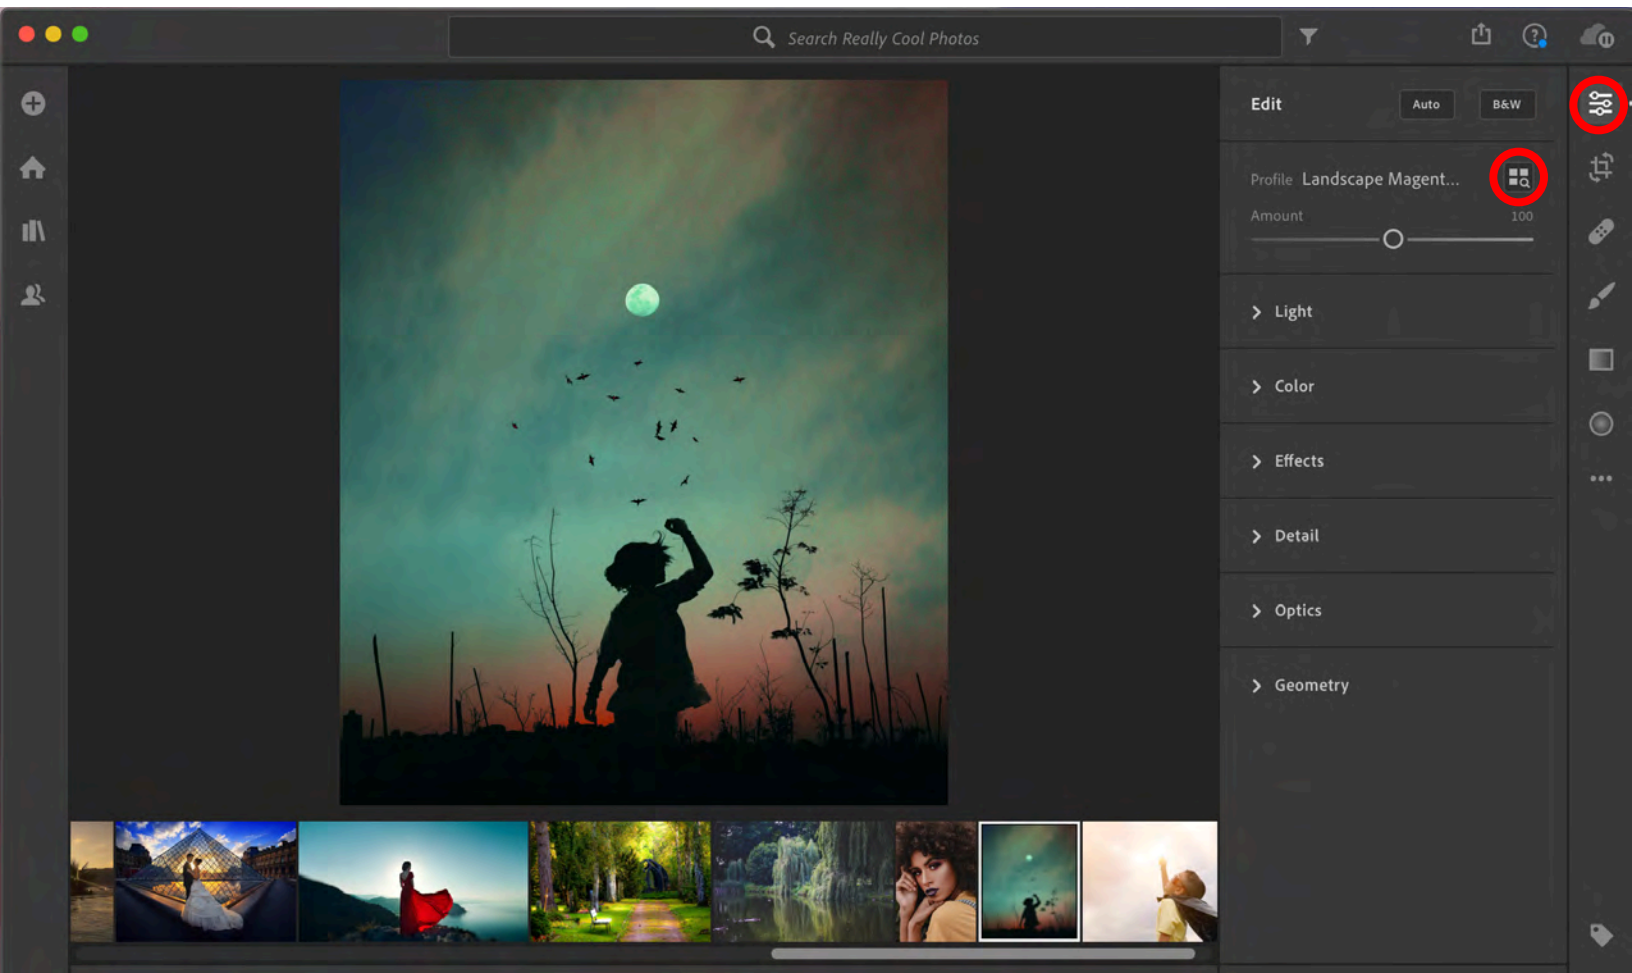

Simply place your cursor over each of the profiles for a preview of the effect. Click a profile to apply it to the image.

7. Try any profile with any photo!

At any point you can return to the Profile menu to choose a different profile or set it back to it's original, even after making Lightroom adjustments and applying presets.

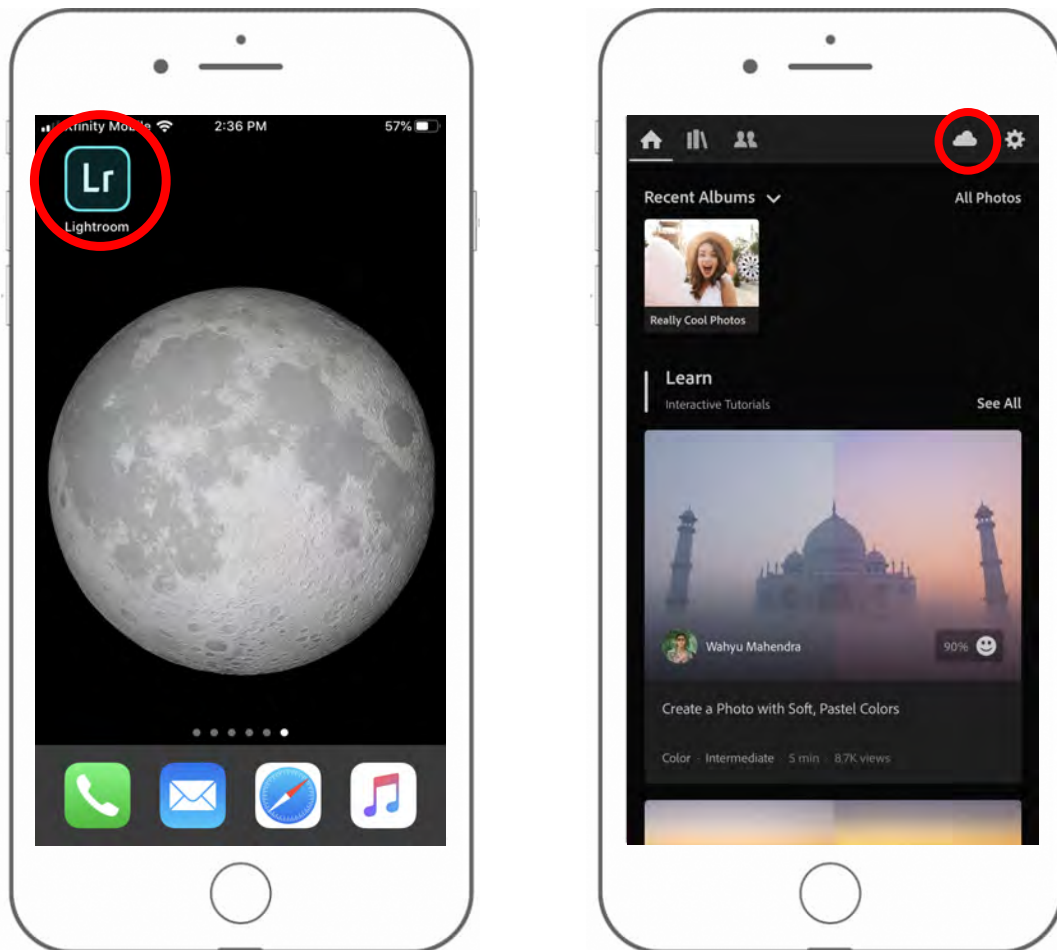

From the toolbar on the right, click the **Edit** icon then click the **Browse All Profiles** icon.

8. Sync Lightroom Mobile (optional)

If you're using Lightroom with a subscription, you can use your new profiles on the Lightroom Mobile app.

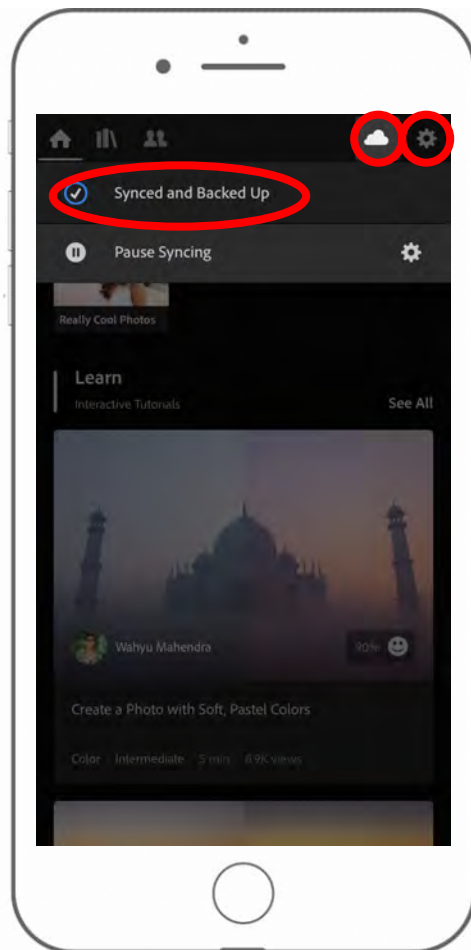

Launch your Lightroom Mobile app from your device. From the top menu bar, click the **Cloud icon**.

9. Make sure you're syncing

Ensure you have syncing enabled. If you do, the top of the cloud menu will say **Synced and Backed Up**.

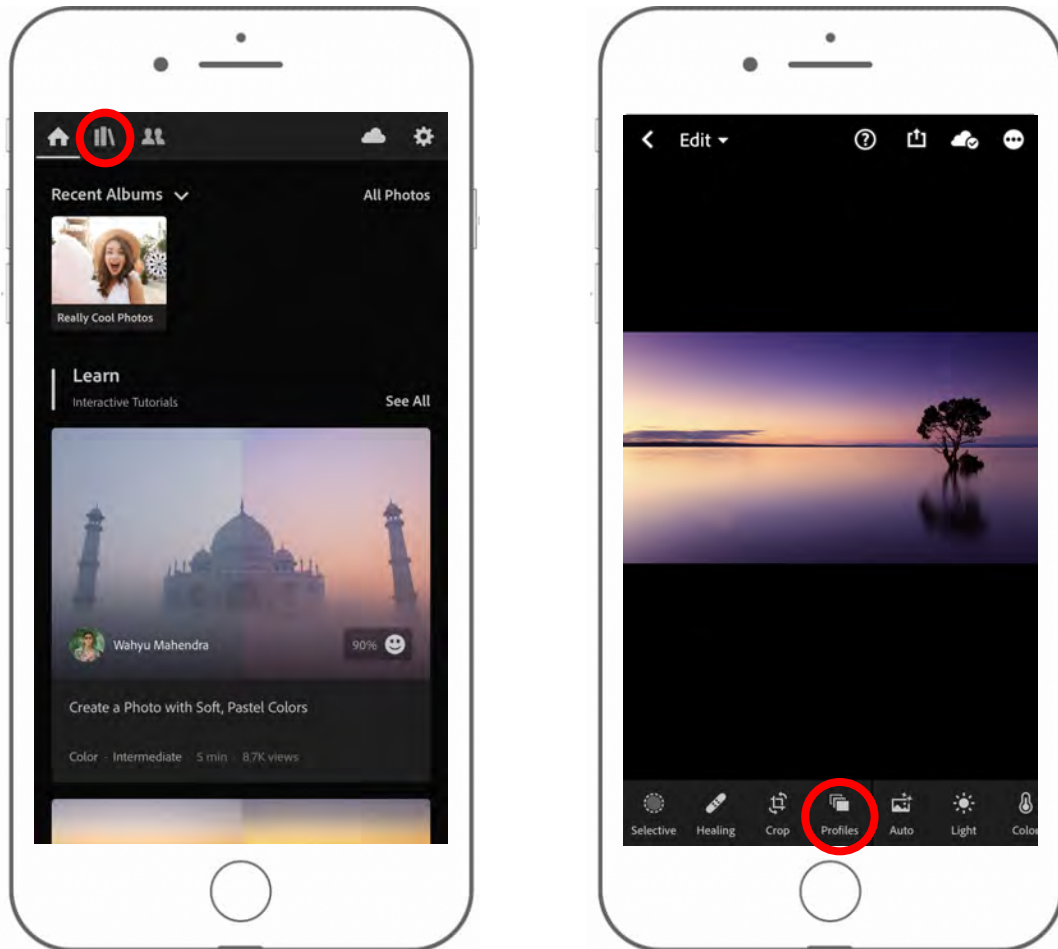

If you are not syncing, make sure you are signed in by tapping **Settings** (gear icon) from the top menu bar.

10. Start editing

From the top menu bar, tap **Library** (books icon) and select a photo.

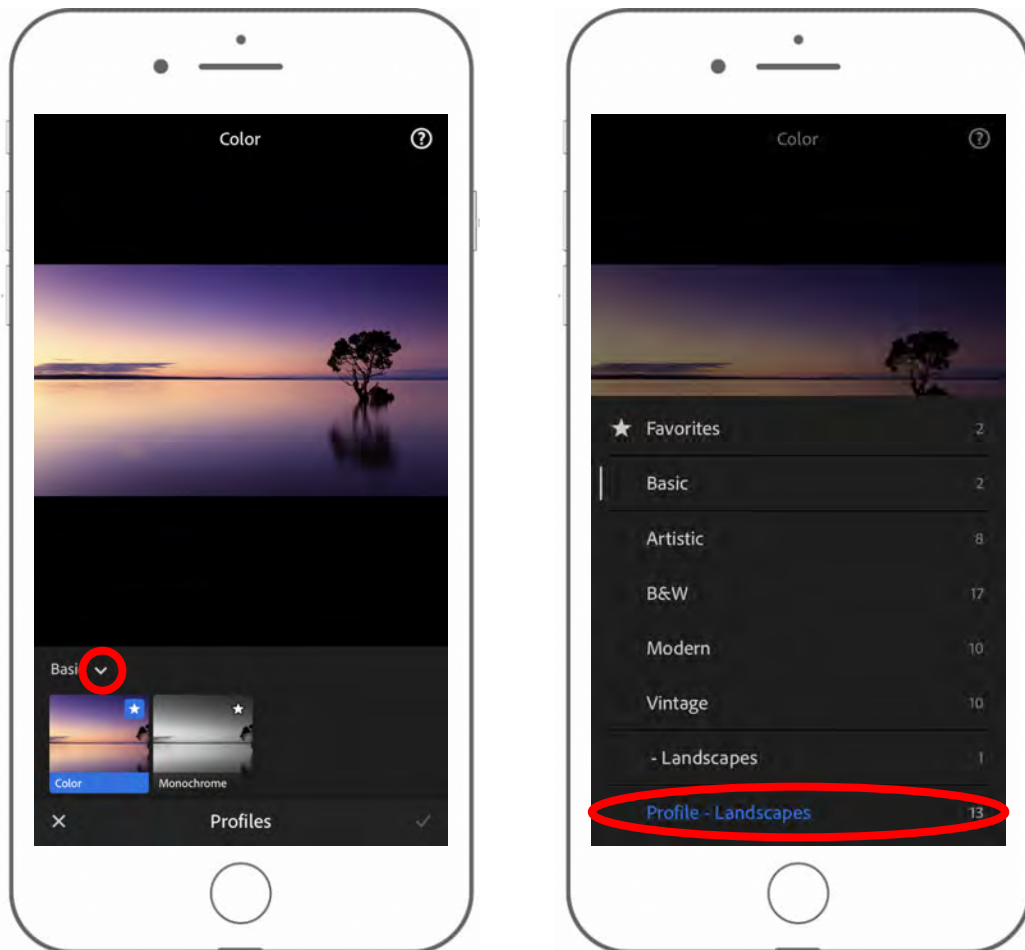

Slide the bottom tool bar all the way to the right then tap **Profiles**.

11. Find your profiles

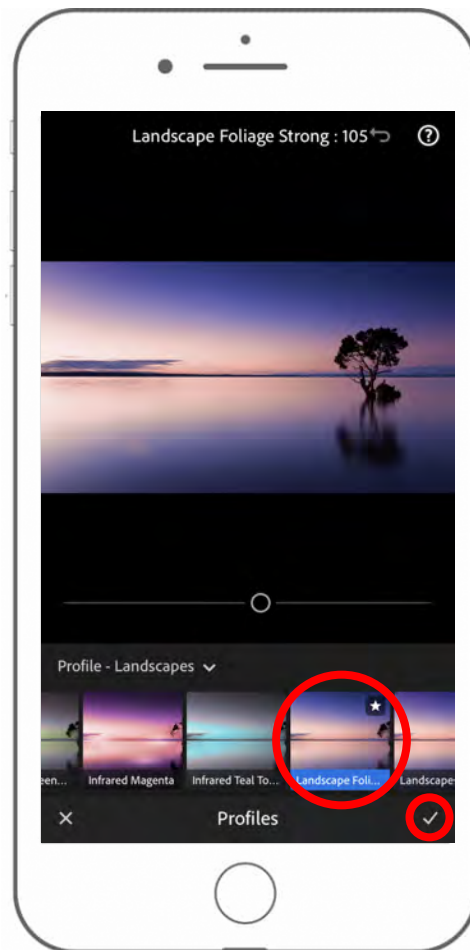

Lightroom automatically opens the last used profiles. Minimize this by tapping the arrow next to the folder.

Tap the profile folder you'd like to use.

12. Use your profiles

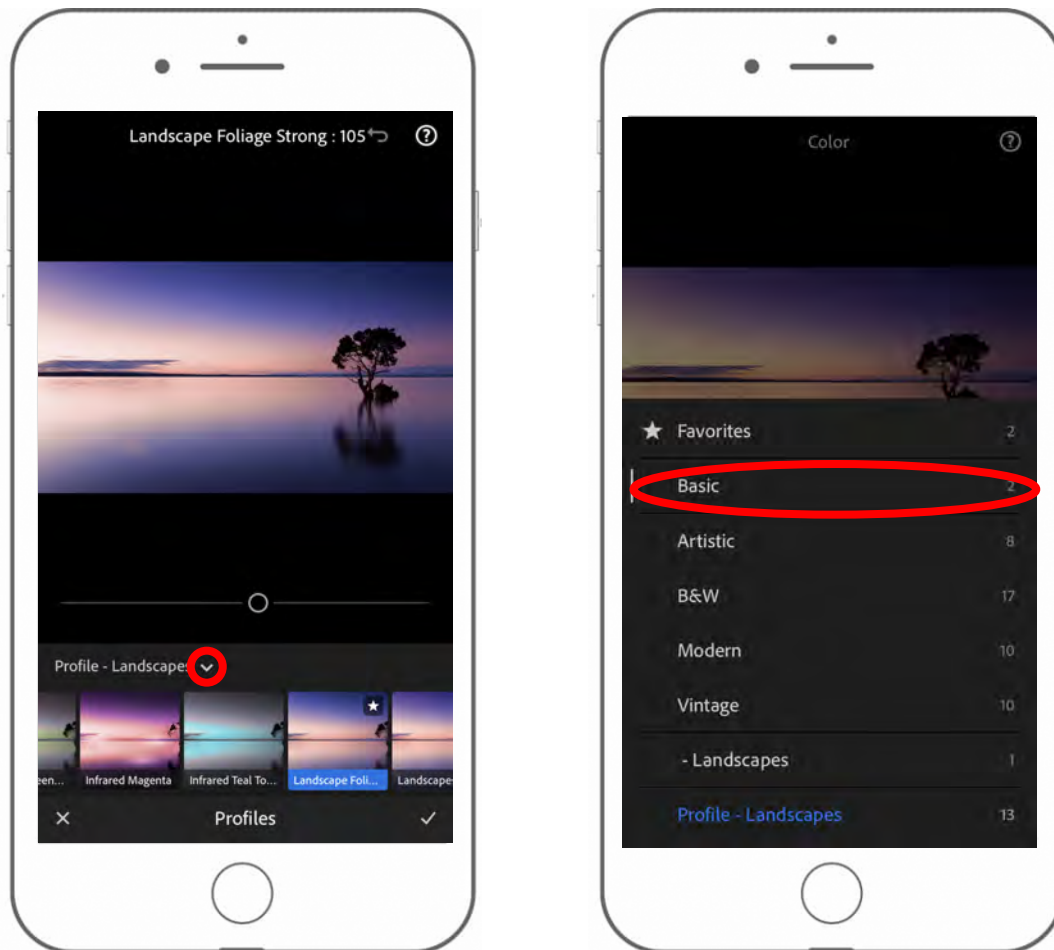

Tap the profile to apply it to your image! Tap the checkmark to save it.

13. Revert or change the profile

At any point you can return to the Profile menu to choose a different profile or set it back to it's original, even after making Lightroom adjustments and applying presets.

To do this, tap the arrow next to the profile folder and select the **Basic** profile folder to revert (or a new one to change profiles), then select the Color or Monochrome profile - whichever applies.

Enjoy!
